

What is the impact of bad layout in the understandability of social goal models?

Catarina Gralha

Universidade NOVA de Lisboa

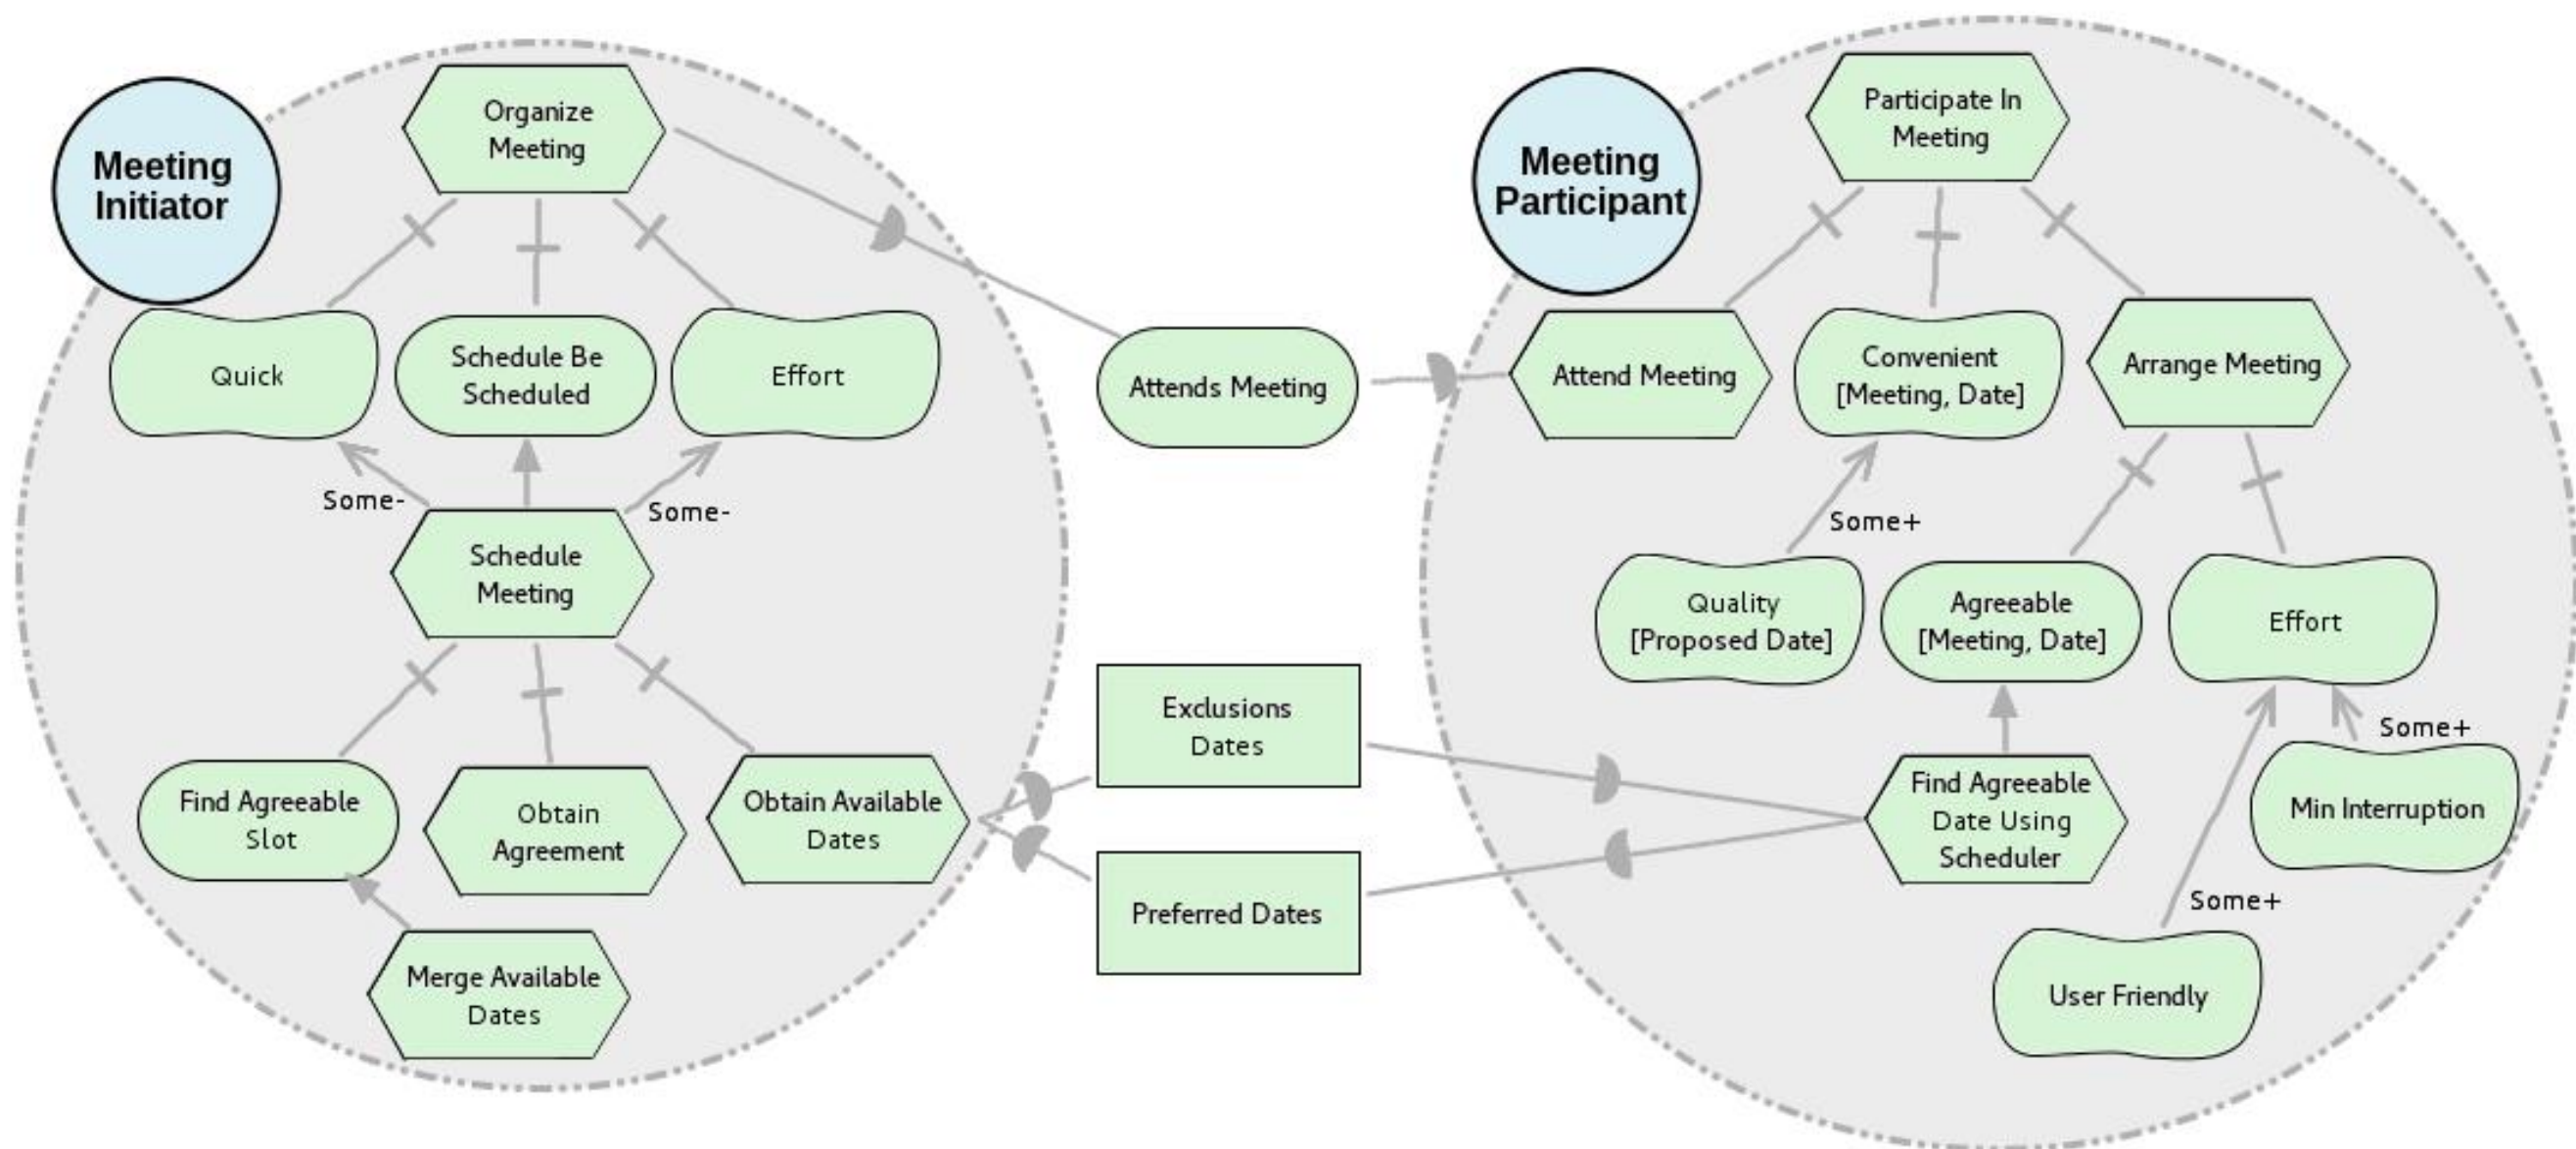

`acg.almeida@campus.fct.unl.pt`

`microlina.github.io`

Social goal models: i^* (iStar)

Approach focused on the system stakeholders and in their (social) relationships

Developed for modelling and reasoning about organizational environments

Research questions

1 Does adherence to **layout guidelines** influence the **understandability** of i^* models?

2 Does adherence to **layout guidelines** influence the **ability to review** i^* models?

Study method: quasi-experiment with a combination of measures

Success level

Precision

Recall

F-Measure

Effort

Two understanding and two review tasks, both with good and bad layout

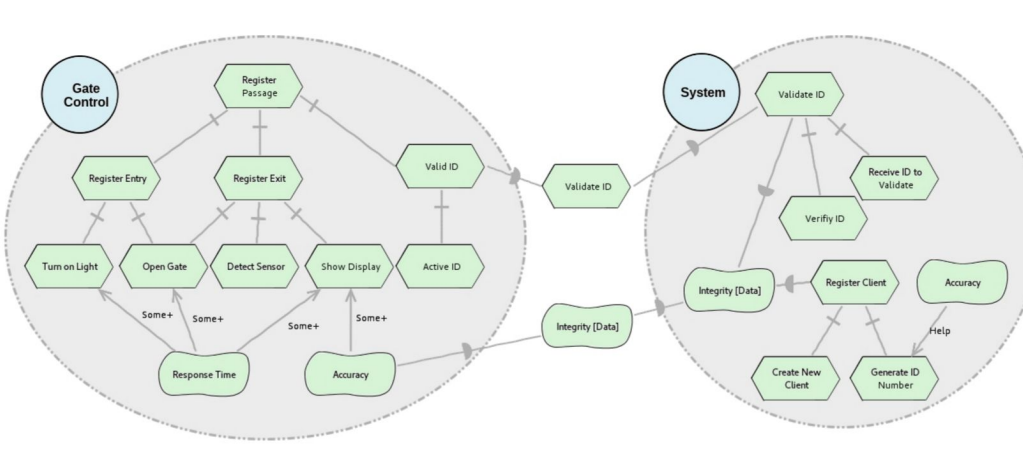

Which tasks are involved in making payments?

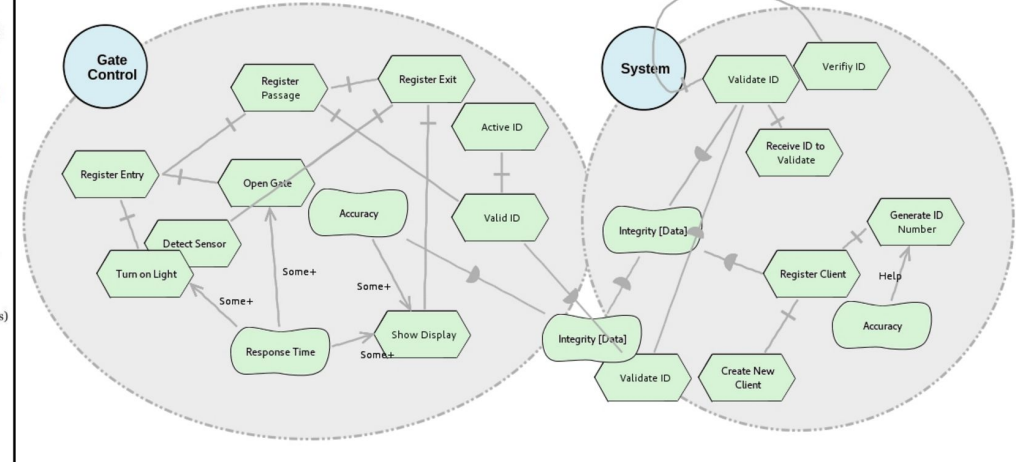

Which tasks are involved in making payments?

Please describe the defects you find in this diagram
(they can be more than one)

Areas of interest: question, key and model

Question

What happens when the patient is monitored?

Key

Model

So what was the impact of good and bad layouts in understanding and reviewing i^* models?

Precision is higher for understanding tasks,
but there is no statistically significant
difference between layouts

Recall is better for understanding tasks with good layout, but the difference is not statistically significant

F-Measure is better for understanding tasks with good layout, but the difference is not statistically significant

There is no difference in terms of **duration**, between good and bad layouts for both tasks

There is no difference in the **perception of complexity** of the tasks, for both layouts

Relevant **fixation rates** were superior in understanding tasks, but the difference for layouts is not statistically significant

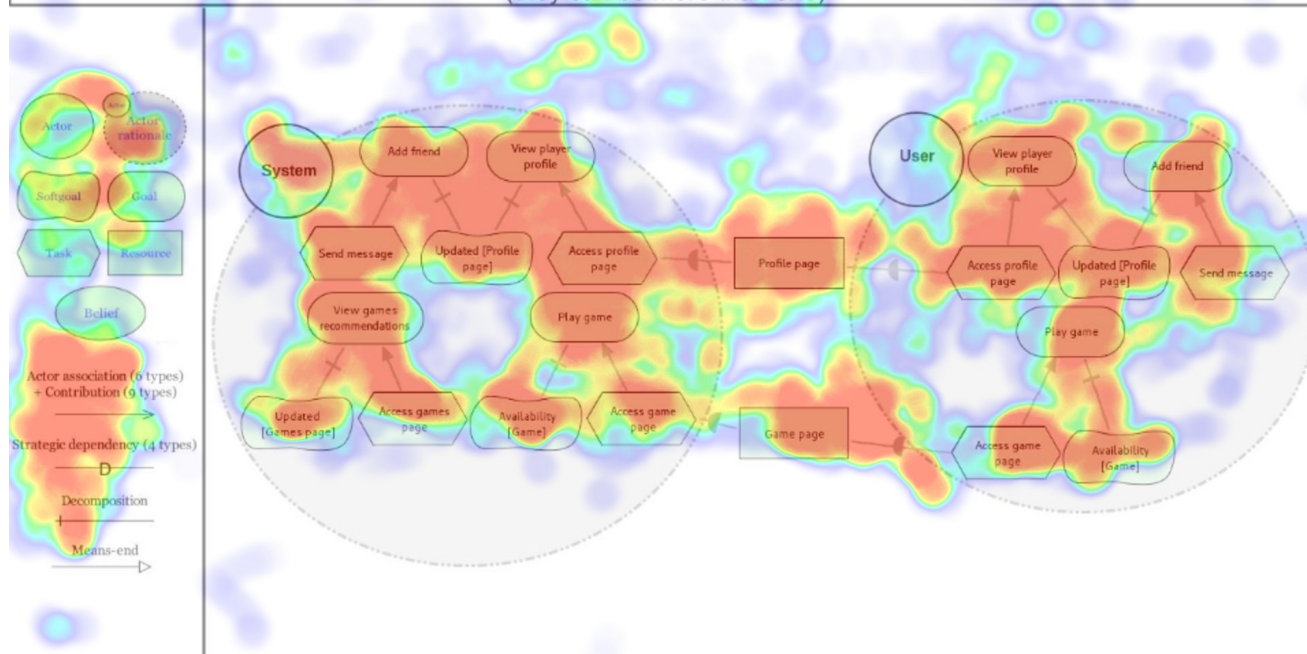

Average fixation duration varies depending on the model, but the difference is not statistically significant

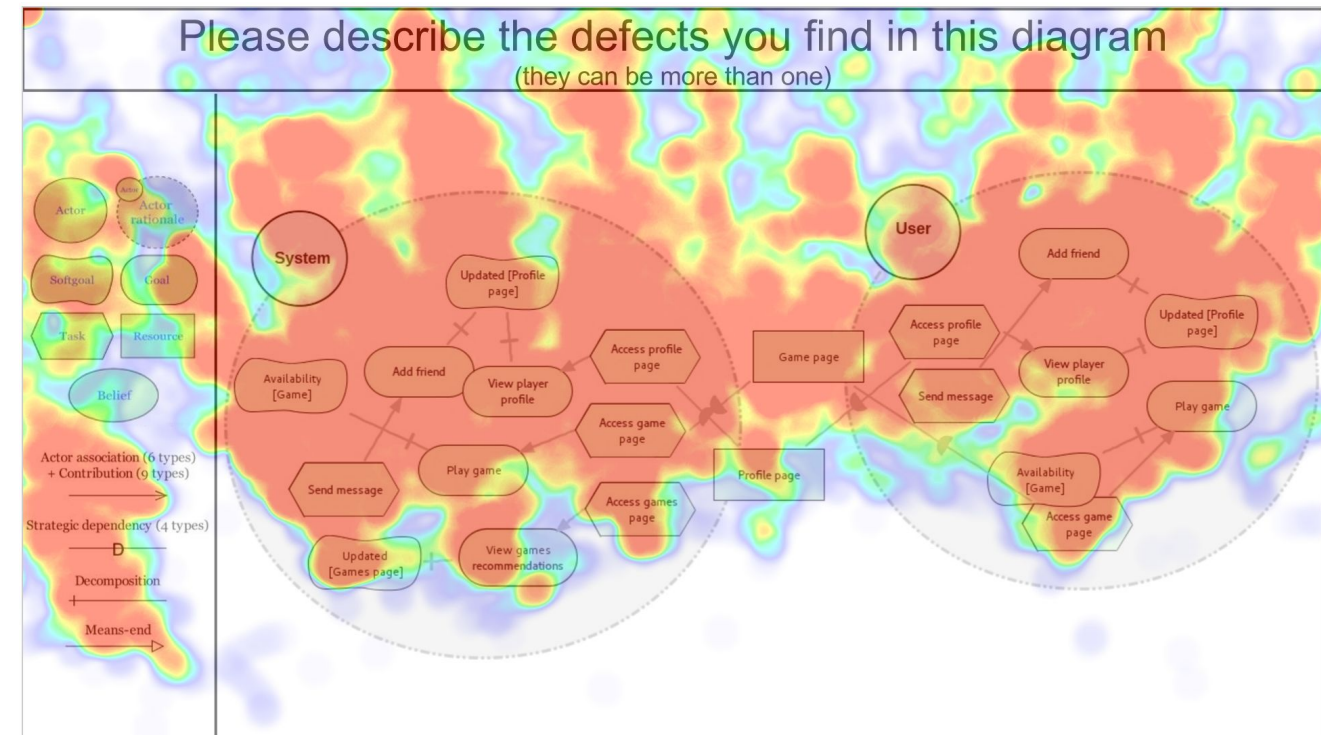

Heat map for the good layout is less scattered than the one for bad layout

Please describe the defects you find in this diagram
(they can be more than one)

Please describe the defects you find in this diagram
(they can be more than one)

Conclusions

Understanding tasks were more accessible than reviewing tasks

The layout was not a significant factor for any of the measures,
for both understanding and review tasks

In heap maps for the review tasks, participants' gaze seemed
more dispersed by the noise cause by bad layouts

We expect layout quality to have a stronger impact as diagrams
increase in size and complexity

Thank you!
